Exercise 3: Core Processes Matrix

Prepare a **Core Processes Matrix** describing the major processes identified in the Level-0 DFD. The processes in this matrix must be the **same major processes represented in the Level-0 DFD**.

At least **5 main processes** are required.

Required Format

Process No. and Name	**Input Data**	**Output Data**	**Rules**
P1 – Order Medication	Order details from Customer; remaining stock information from D2 Inventory	Inventory depletion information sent for inventory updating	The system checks the requested medication and quantity against available inventory. An order can proceed only when sufficient stock is available. The ordered quantity must be used to determine the required inventory depletion.
P2 –Submit Prescription	Prescription submitted by Customer	Prescription details stored in D1 Prescriptions	The system accepts the customer's prescription and records its details in the prescription data store. A submitted prescription must be associated with the relevant customer/order so that it can later be reviewed.
P3 – Manage Prescription	Prescription details from D1 Prescriptions; approve/deny decision from Pharmacist or authorized Owner/Admin	Updated prescription status stored in D1 Prescriptions	Only an authorized user may approve or deny a prescription. The prescription must first exist in D1 before it can be reviewed. The status is

			updated according to the authorized review decision.
P4 – Manage Inventory	Add/remove medication and restocking information from Owner/Admin	Inventory change/restocking information sent to P5 Update Inventory	Only an authorized Owner/Admin may request administrative inventory changes. Medication quantities and restocking values must be valid before an inventory update is performed.
P5 – Update Inventory	Inventory depletion information from medication ordering; inventory change/restocking information from P4 Manage Inventory	Updated inventory information stored in D2 Inventory	Inventory quantities are decreased when medication is consumed by an order and increased when medication is restocked. Updates must maintain valid stock quantities and must not result in negative inventory values.
